Notes *1 Representative value; actual value is noted on calibration sheet supplied with accelerometer.

*2 Representative value when mounted on flat surface according to standard mounting method (*3).

● Please take care not to drop accelerometers and carefully handle them with attachments. There is likely to be trouble of piezoelectric accelerometers by (giving) excessive shock. The excessive shock carries some damages onto piezoelectric ceramic element.

For extension between accelerometer and vibration meter

Vibration Meter Preamplifier VP-26A

- Prevents sensitivity degradation by accelerometer cable
- Prevents increase in external noise
- Suitable for low-output accelerometers

Specifications

Sensitivity	1 mV/pC
Frequency range	0.16 Hz to 30 kHz
Supplied accessory	Cable (EC-02S, 3 m)

Extension examples

Support for CCLD (Constant Current Line Drive)

Charge Converter

(For direct connection to BNC input)

VP-40

- Simplifies the configuration of a vibration measurement system using a piezoelectric accelerometer with charge output

Specifications

	VP-40	VP-42
Gain	1 mV/pC ±2.5 % (80 Hz)	1 mV/pC ±2.5 % (80 Hz)
Frequency range	1 Hz to 30 kHz (±5 %)	1 Hz to 30 kHz (±5 %)

Charge Converter (Compact relay type)

VP-42

Connection example

Servo Accelerometer

These accelerometers support vibration measurement in the ultra-low frequency range from DC to about 100 Hz with flat frequency response. A low-noise vibration waveform can be obtained also when converting acceleration into velocity or displacement. Using the dedicated LF-20 power supply, the output can be supplied directly to an FFT analyzer, data recorder or similar device.

- The noise level rating of the LS-40C is 6 times lower than that of the LS-10C, making it suitable also for measurement of very low-level vibrations.
- Very low power consumption enables long-term measurements even when operating on battery power.

Servo Accelerometer LS-40C

Specifications

	LS-40C	LS-10C
Maximum measurable acceleration	±20 m/s ²	±30 m/s ²
Sensitivity	Voltage sensitivity	0.5 V/(m/s ²) ±1 % (DC)
	Thermal coefficient	0.01 %/°C (typical value)
	Measurement frequency range	DC to 100 Hz (±10 %)
Residual noise*1 (representative value)	Max. 1.1×10 ⁻⁷ (m/s ²)/√Hz (20 Hz)	Max. 7×10 ⁻⁷ (m/s ²)/√Hz (10 Hz)
Self-test	Output vs. signal input 1/10 ±10 %	
Waterproof ranking	JIS C 0920: 2003, class 7 (temporary submersion), IEC 60529: 2001, IPX7	
Dimensions	37(H)×37(W)×40(D)mm, Mounting flange 51 mm, mounting hole pitch 44 mm	
Weight	Approx. 230 g (including cable)	Approx. 220 g (including cable)
Supplied accessories	Insulating plate*2	

*1 In the frequency range other than 10 Hz, noise will be higher than the given value.

*2 The insulating board has a protrusion both on the front and on the back. If the insulation plate is to be used on the side where vibrations are to be measured, it may be necessary to make a modification.

Servo Accelerometer LS-10C

Extension cables for servo accelerometer

Name	Model	Cable diameter	Length
Extension cables for servo accelerometer	EC-40A	φ6.2	5 m
//	EC-40B	//	10 m
//	EC-40C	//	30 m (with reel, supplied with EC-40S)
//	EC-40D	//	50 m (with reel, supplied with EC-40S)
Servo accelerometer junction cable	EC-40S	//	5 m (for connection of LF-20 and reel)

Noise characteristics (representative) LS-40C

Noise characteristics (representative) LS-10C

Frequency response and phase response (representative) LS-40C/10C

Servo Accelerometer Power Supply LF-20

- Continuous operation with three LS-40C units approx. 50 hours, with three LS-10C units approx. 100 hours

3-Axis Mounting Base LS-13V

- Allows mounting of three servo accelerometers for simultaneous vibration measurement in three directions.

What is the piezoelectric accelerometer?

Certain types of crystals will generate an electrical charge on their surface when pressure is applied. The amount of the charge is proportional to the external force. This phenomenon is called the piezoelectric effect, and the vibration acceleration sensor called a piezoelectric accelerometer makes use of it.

Piezoelectric accelerometers can be made compact and lightweight, allowing them to cover a wide vibration frequency range. Accuracy and reliability are also very good, and handling is simple.

Thanks to these characteristics, piezoelectric accelerometers are widely used for many general applications, and also serve as reference accelerometers. There are two types of piezoelectric accelerometers, namely shear-type and compression-type, which differ in the way the piezoelectric element is used.

Shear-type accelerometer

The accelerometer is constructed in such a way that the piezoelectric element is subjected to a shear force. Sensitivity is high, which allows for small dimensions. Pyronoise (pyroelectric output) caused by temperature changes is low, which is advantageous for measuring low-level vibrations and vibrations in the low frequency range. This type is useful for monitoring vibrations in machinery and buildings, and for seismometer applications.

Piezoelectric accelerometer types

Shear-type accelerometer

Principle of shear-type accelerometer

Compression-type accelerometer

This type of accelerometer employs a weight on top of the piezoelectric element. The structure is simple and mechanical strength is high, making it suitable for high acceleration levels and shock measurements.

Piezoelectric accelerometer types

Compression-type accelerometer

- When using a piezoelectric accelerometer with a TEDS compliant measuring device, sensitivity setting must be performed.
- In case of a TEDS compliant piezoelectric accelerometer, sensitivity setting is not required.

TEDS compliant piezoelectric accelerometer

This refers to a piezoelectric accelerometer that fulfills the **TEDS (Transducer Electronic Data Sheet)** requirements.

TEDS is a standard defined in IEEE1451.4, providing for sensor specific information such manufacturer, model, sensitivity, mass etc. to be recorded in the piezoelectric accelerometer, allowing this information to be read by other equipment as needed. Some vibration meters and frequency analyzers are equipped with circuitry and software to read the sensor information. When connected to such equipment, sensor sensitivity will be automatically set. This is highly convenient especially when performing multi-point simultaneous measurement. Eliminating the need for making input settings for a large number of piezoelectric accelerometers saves time, and automatically adapting the sensitivity setting when a connection has been changed also helps to reduce measurement errors.

JCSS
JCSS 0197

RIION Co., Ltd. is recognized by the JCSS which uses ISO/IEC 17025 (JIS Q 17025) as an accreditation standard and bases its accreditation scheme on ISO/IEC 17011. JCSS is operated by the accreditation body (IA Japan) which is a signatory to the Asia Pacific Laboratory Accreditation Cooperation (APLAC) as well as the International Laboratory Accreditation Cooperation (ILAC). The Quality Assurance Section of RIION Co., Ltd. is an international MRA compliant JCSS operator with the accreditation number JCSS 0197.
